

Cloprostenol Veyx™

VDD
Approved

Cloprostenol injection -
250 µg/mL

Sterile synthetic prostaglandin

Therapeutic Indications:

By its ability to shorten the life span of the *corpus luteum* Cloprostenol Veyx™ can be used to treat certain clinical conditions which delay breeding, to manipulate the estrous cycle to better fit certain management practices, and to induce abortion.

- Sub-estrus (silent heat or non-detected estrus)
- Pyometra or chronic endometritis
- Pregnancies from mis-mating and abortion in feedlot heifers
- Mummified fetus

Controlled Breeding:

The luteolytic action of Cloprostenol Veyx™ can be used to schedule estrus and ovulation for an individual animal or a group of animals. This allows control of the time at which cycling cows or heifers can be bred.

Dosage and Administration (IM Injection):

For Therapeutic Indications - 2 mL
For Controlled Breeding - 2 mL
For Abortion - 1.5 mL (2 mL for animals over 455 kg)

See package insert for full information on injection regimens, side effects, precautions, warnings and contraindications.

Packaging:

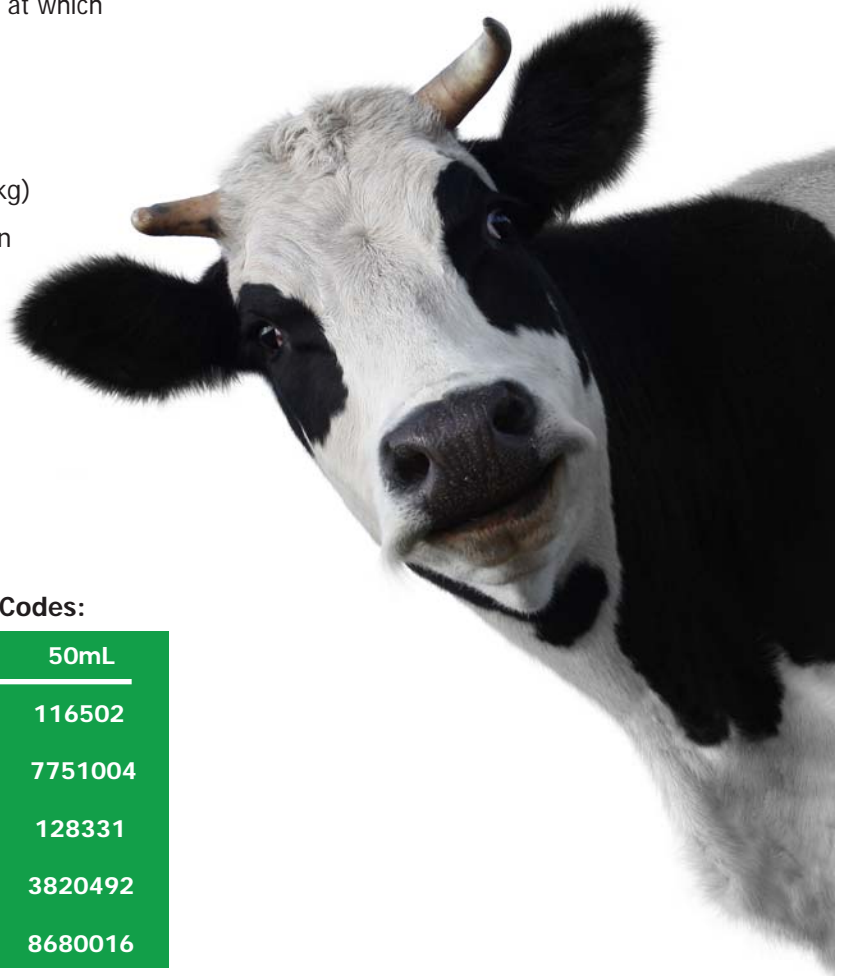

50mL multidose vials

Storage:

15° - 30° C. Protect from light.
