

Anigen Rapid Test Kit

Canine Parvovirus Antigen Test Kit

Immunochromatographic test for the qualitative detection of canine parvovirus antigen in canine feces.

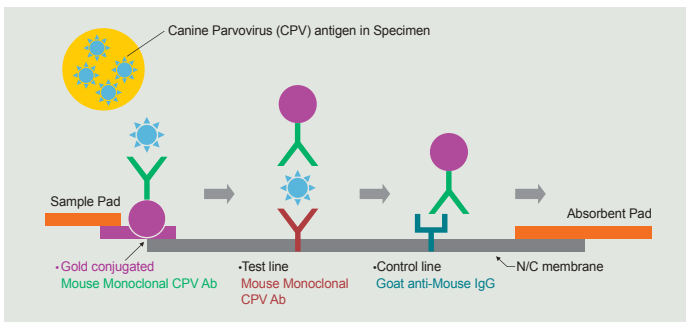

Canine parvovirus (CPV) attacks the intestinal tract of dogs, causing severe vomiting and diarrhea. Three slightly different pathogenic strains of CPV (CPV-2a, CPV-2b and most recently CPV-2c) causing similar clinical signs have been identified. The diarrhea often has a very strong smell, and dogs show clinical signs usually within 7~10 days of the initial infection. CPV is extremely hardy, surviving extreme heat and subzero temperatures for long periods of time, and is a deadly threat to an unvaccinated dog or puppy.

Features of ANIGEN Rapid Test Kit:

- Highly purified antibodies produced by biotechnology for the detection and capture of canine parvovirus antigen (Patent pending)
- **Detection of pathogenic strains of CPV**
- Highly sensitive and specific
- Fast results within 5 min.
- Simple and easy to use
- Works with feces
- Storage at room temperature
- Small sample volume
- 2-year shelf life
